

a Asymmetric F2 spatial risk

b Long-horizon sampled F2 fault density

1,000,000 s; 1,888 sampled faults; conditional expectation 1880.6; bin risk-rate Pearson $r=0.822$.

Panel b uses raw 2.5 x 2.5 degree counts on a continuous 0--13 count scale with colors accelerated above count 5.

Zero-count and outside-F2 areas use the darkest palette color; a fixed three-stage rule adjusts 22 display cells; circles retain the individual raw event locations.
